

Here is the file and I also have the API info.

Need pagination added and sorting. It's mainly CSS file but JS file is blank. Need frontend to be connected to backend showing real data from API.

Is that the main info you needed? I don't have more requirements than that. Later we can make more changes to CSS but that's it for now.

```
@api_view(["GET"])
def collections(request):
    params = request.query_params

    # Query limit
    limit = params.get("limit", "10")

    if limit.isdigit() and int(limit) > 0:
        limit = int(limit)
    else:
        logger.warning(f'Invalid limit value: {limit}')
        return Response({"message": f'Invalid limit value: "{limit}"'},
            status=status.HTTP_400_BAD_REQUEST)

    # Query offset
    offset = params.get("offset", "0")

    if offset.isdigit() and int(offset) >= 0:
        offset = int(offset)
    else:
        logger.warning(f'Invalid offset value: {offset}')
        return Response({"message": f'Invalid offset value: "{offset}"'},
            status=status.HTTP_400_BAD_REQUEST)

    # Query sort
    sort = params.get("sort", "_id")

    if sort in ["_id", "slug", "website", "domain_authority", "page_autho
    sort = sort
    else:
        logger.warning(f'Invalid sort value: {sort}')
        return Response({"message": f'Invalid sort value: "{sort}"'},
            status=status.HTTP_400_BAD_REQUEST)
```
